Overview

The **Proof of Delivery Wireless IT Solution** is designed to transmit the actual full-page view of the signed *Bill of Lading* to the corporate IT server over the wireless data network. This allows transport companies to provide “**Proof of Delivery**” to their clients that the shipment has been accepted at the proper destination.

Most clients prefer the actual full-page view of the *Bill of Lading*, as it is the practical, if not traditional, document to capture comments on the state of goods and other customer service issues, if any.

Models

There are two models, the Mobile Unit (shown above with the external display unit), which is to be installed in a specific vehicle. The Portable Unit (not shown), which can be transferred from vehicle to vehicle.

Wireless Network Support

Both models can be ordered with support for either cellular data transmission standard: GSM-GPRS or CDMA-1xRT/EVDO. CVL through its partners provides excellent rates and support on the North American wireless data networks.

Ease of Use

Simplicity is one of the key factors in the user acceptance and success of any IT application.

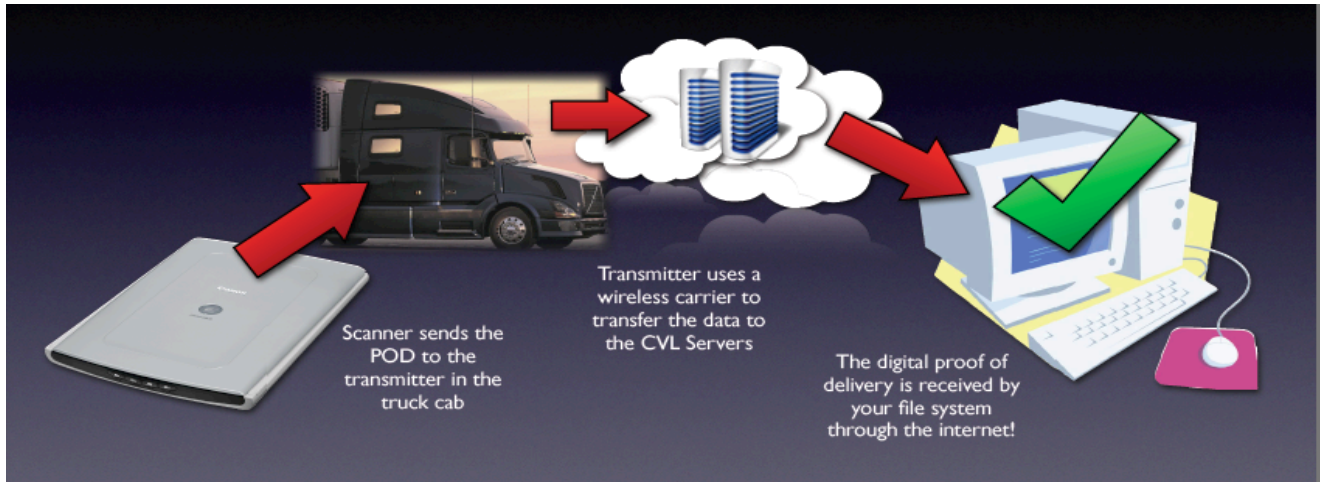

The **Proof of Delivery Wireless IT Solution** incorporates a patent - pending process that enables the wireless transfer of the full-page view of the *Bill of Lading* or any other document with the touch of a single button on the simple to operate flat bed scanner.

Simple and practical operational functionality extends to the user interface. Both models include a set of colour-coded visual indicators to indicate when the **Proof of Delivery Wireless Solution** is ready to scan the document and transmit.

Benefits

- **ACCELERATES YOUR INVOICING CYCLE.**
- IMPROVES CUSTOMER SATISFACTION WITH TIMELY AND ACCURATE “**PROOF OF DELIVERY**”.
- IMPROVES BUSINESS EFFICIENCY BY REDUCING THE LOSS AND MISHANDLING OF DOCUMENTS.
- AUTOMATES THE “**PROOF OF DELIVERY**” PROCESS
- REDUCES THE COST OF OPERATIONAL RESOURCES.

AUTOMATED PROOF OF DELIVERY PROCESS
