

# PROOF OF DELIVERY

*Portable Unit*

*Portable Unit*

## Overview

The **Proof of Delivery Wireless IT Solution** is designed to transmit the actual full-page view of the signed *Bill of Lading* to the corporate IT server over the wireless data network. This allows transport companies to provide “**Proof of Delivery**” to their clients that the shipment has been accepted at the proper destination.

Most clients prefer the actual full-page view of the *Bill of Lading*, as it is the practical, if not traditional, document to capture comments on the state of goods and other customer service issues, if any.

## Models

There are two models, the Mobile Unit, which is to be installed in a specific vehicle, and the Portable Unit, which can be transferred from vehicle to vehicle.

## Wireless Network Support

Both models can be ordered with support for either data transmission standard: GSM-GPRS or CDMA-1xRT/EVDO. CVL through its partners can provide excellent rates and support on the North American wireless data networks.

## Ease of Use

Simplicity is one of the key factors in the user acceptance and success of any IT application.

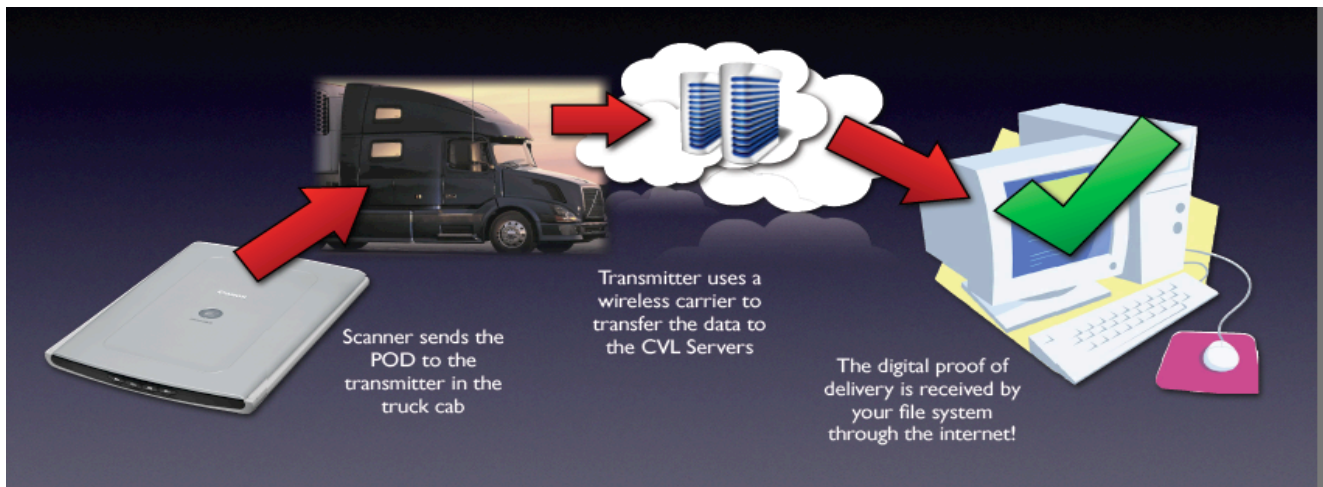

The **Proof of Delivery Wireless IT Solution** incorporates a patent - pending process that enables the wireless transfer of the full-page view of the *Bill of Lading* or any other document with the touch of a single button on the simple to operate flat bed scanner.

Simple and practical operational functionality extends to the user interface. Both models include a set of colour-coded visual indicators to indicate when the **Proof of Delivery Wireless Solution** is ready to scan the document and transmit.

## Benefits

- Accelerates your invoicing cycle.
- Improves Customer Satisfaction with timely “**Proof of Delivery**”.
- Improves business efficiency by reducing the loss and mishandling of documents.
- Automates the “**Proof of Delivery**” process
- Reduces the cost of operational resources.

**AUTOMATED PROOF OF DELIVERY PROCESS**

## Feature Summary
