

REMOTE PRINTING

Extend your real time document printing to the truck cab!

Overview

The CVL Wireless Remote Printing System is designed to remotely retrieve a business document from the corporate IT server over the wireless data network and the Internet.

This allows companies to print updated transport documents and new instructions, real time, right in the cab. The process is easy to use and is activated with the press of a single button, no screens or keyboards.

Models

The CVL Wireless Remote Printing System can be ordered either model of the **Proof of Delivery Wireless IT Solution**, specifically the Mobile Unit, which is to be installed in a specific vehicle, and the Portable Unit, which can be transferred from vehicle to vehicle.

Wireless Network Support

Both models can be ordered with support for either data transmission standard: GSM-GPRS or CDMA-1xRT/EVDO. CVL through its partners provides an excellent rate package and support on the North American wireless data networks.

Ease of Use

Simplicity is one of the key factors in the user acceptance and success of any IT application.

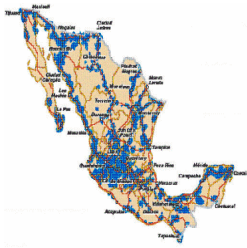

The **Proof of Delivery Remote Printing Solution** incorporates a patent - pending process that enables the wireless transfer of print documents with the touch of a single button on the "simple to operate" flat bed scanner.

Simple and practical operational functionality extends to the user interface. The mobile and portable **Proof of Delivery Wireless IT** units include color-coded visual indicators that indicate when the **CVL Wireless Remote Printing System** is ready to retrieve the document and print in the cab.

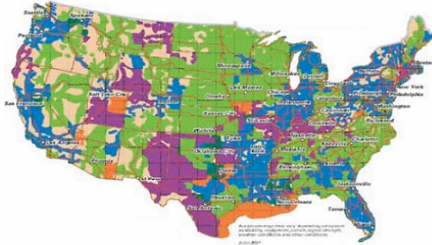

Benefits

- Real time document availability.
- Improved accuracy of documents
- Facilitates additional pick-ups
- Improves operational efficiency
- Minimal training required
